-!- CATALYTIC ACTIVITY: An alkanesufonate (R-CH(2)-SO(3)H) + FMNH(2) +
0(2) = an aldehyde (R-CHO) + FMN + sulfite + H(2)O.
-!- SIMILARITY: Belongs to the ssuD family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   "Complete genomic sequence of nitrogen-fixing symbiotic bacterium Bradyrhizobium japonicum USDA110.";

The antibody binds to a target structure displayed in and on the cell surface of human gastrointestinal epithelial tumour cells and in a subpopulation of normal human gastrointestinal epithelial The and in target structure especially comprises alphaébeta integrin. This is a tumour-associated antigen. The antibody, and its fragments, are useful for treating conditions based on anti-angiogenic mechanism in humans. They are useful for treating human metastatic and malignant disease, for in vito, in vivo diagnosis and prognosis of human malignant disease, comprising tumour typing, tumour screening, tumour diagnosis and prognosis and monitoring premalignant conditions. Quantitative in vivo tumour deposits is carried out by determining the localization of antibody to tumour deposits in humans

The invention comprises a method (ribosome display system) for obtaining a specific binding pair (sbp) member that binds a complementary sbp member of interest. The method involves incubating mRNA molecules encoding an sbp and lacking an in-frame stop codon, allowing ribosome translation of the mRNA to produce the encoded sbp member, forming complexes comprising ribosome, mRNA, and encoded sbp member displayed on the ribosome. The ribosome display system is useful for the selection of an sbp member able to bind a complementary sbp member. The present amino acid sequence represents a GPI-linked cell surface receptor-specific VL
                                                                                                         Ribosome display system; specific binding pair; sbp; anti-FITC; VL CDR3; scFv antibody generation; GFI-linked cell surface receptor.

The present invention describes a method (M1) for amplifying a nucleic acid strand. M1 comprises providing an engineered nucleic acid strand (S) acid strand. M1 comprises providing an engineered nucleic acid strand (S) having a predetermined sequence at the other, and contracting (S) with a primer having the predetermined sequence in the presence of a polymers contactides. Also described is an engineered nucleic acid strand (I) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence at one end and a sequence complementary to the predetermined sequence at the other end. M1 is useful for ilbrary. M1 is useful for producing an antibody librard into a suitable expression vector, where the vector can be used to transform an appropriate host organism to produce the polypeptide or protein encoded by the target sequence. M1 is useful to amplify a family of related sequences to build a complex library such as, for example an antibody library. M1 is useful not only for producing large amounts of the present uncleic acid sequence, but also for amplifying simultaneously more than one different target nucleic acid sequence. Our also sequence located on the same or different uncleic acid molecules. Acc62635 to Acc62753 and ABR54811 to antibuted accomplex library such as ABR54811 to antibute accomplex library.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulator; immunosuppressive; immunostimulator; antirheumatic; antiAIDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematoeus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.
                                                                                                                                                                                                                                           Amplifying nucleic acid by contacting engineered nucleic acid strand having predetermined sequence at one end and sequence complementary to predetermined sequence at other end, with primer having predetermined

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TWS) super family and induces B cell tumour necrosis factor (TWS) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP4728 represent the introduces antibodies and fragments of the antibodies described in the method of

```
This invention describes novel antibodies that immunospecifically bind to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          BLyS
                                                                                                                                                                                                                                                                                                                                                                                                                    Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (CVID) and immunodeficiency (CVID) and immunodeficiency (CVID) and immunodeficiency (CVID) and immunodeficiency (CVID) and immunodeficiency (CVID) and immunodeficiency (CVID) and immunodeficiency (CVID) and content and activity and activity and activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

(HUMA-) HUMAN GENOME SCI INC. (CAMB-) CAMBRIDGE ANTIBODY TECHNOLOGY.

Hilbert Choi GH, Vaughan T, Ruben SM, Barash SC, Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

This invention describes novel antibodies that immunospecifically bind to

Claim 1; Page 2763-2764; 3148pp; English

The invention relates to transforming a population of cells (e.g. plant cells), comprising using a library of two different polynucleotides encoding different immunoglobulin binding protein (IGBP) polypeptides that specifically bind to a ligand for one or more disulphide bonds with polypeptides in transferted cells, to generate an IGBP that binds to a ligand, and transformed plant cells are selected, and preparing an IGBP array in plant cells. At least one peptide sequence has at least 75%

           tumour necrosis factor (TMS) where family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BuyS. The antibodies bind to BuyS and so may be used to detect and quantitate the presence of BuyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BuyS. They may also be administered to treat diseases oused with aberrant BuyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency syndrome (InDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of

otitidis in the biological sample, (10) a kit comprising a container containing the novel polynucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the genetically engineered host cell under conditions suitable to produce the polypeptide from the culture. (1) can be used in gene therapy. The polynucleotides, polypeptides, antibodies and compositions of the present invention can be used for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials. The polynucleotides are useful for expressing and detecting Alloiococcus otitidis. The present sequence represents an Alloiococcus otitidis

The present invention describes an isolated polynucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis is a Gram-positive bacterium. Also described: (1) an isolated polypeptide that is encoded by the polynucleotide (I); (2) an expression vector comprising the novel isolated polynucleotide (I), its complement, despendant or fragment; (3) a genetically engineered host cell, transfected, transformed or infected with the vector of (2); (4) an antibody specific for the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide, its complement, biological equivalent or fragment, or the polynucleotide that is comprised in the expression vector; (6) a pharmaceulical composition comprising the polypeptide of (1) and a carrier; (7) a protein chip comprising an array of the polypeptides of (1), their biological equivalent or fragment; (8) immuniaing against Alloiococcus otitidis by administering to a host the immunogenic composition; (9) detecting and/or identifying Alloiococcus
                                                                                                                                                                                                                                                                                      ö
sequence identity to a framework region (FR) of a native IgM, IgG, IgA, IgD. IgE, IgY, kappa or lambda immunoglobulin molecule. The method is useful for preparing an immunoglobulin binding protein array, preferably heavy chain binding protein (GHBP) array in eukaryotic cells especially plant cells (e.g. Agrobacterium tumefaciens or maize) or other eukaryotic cells (e.g. insect cells or mammalian cells). The GHBP is useful for discovery of e.g. screening assays of IgBPs having desired characteristics. The present sequence is a mammalian immunoglobulin derived peptide that may be incorporated into an IgBP of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.

```
This polypeptide sequence comprises the VL domain of human scFv antibody 10A6, which is specific for transforming growth factor (TGF) beta-1. It is encoded by a gene (AAT60384) isolated from a peripheral blood lymphocyte library. The antigen-binding domains of human antibodies (see AAW15522-40) to TGF beta-1 and/or beta-2 can be used to counter the

```
The invention relates to regulating a gammadelta T-cell mediated immune response in a mammal and involves administering to the mammal a soluble gammadelta T cell receptor (TCR). The method is useful for treating patients having, or are at risk of developing an intestinal condition, e.g. Crohn's disease, ischaemic colitis, irritable bowel disease, and color cancer; a lung condition associated with inflammation such as a condition associated with inflammation such as a metastatic lung tumour; a skin condition associated with inflammation or cancer as skin legion caused by bacterial infection, viral infection or laceration, and a skin cancer; or a condition associated with inflammation of the reproductive tract such as infection caused by bacterial or viral infection that involve the epithelial mucosal lining, a tubal infection, preventing tubal factor infertility, and a cancer selected from ovarian, cervical, uterine, prostate or testicular cancers selected from ovarian, cervical, uterine, prostate or testicular cancers selected from several controls.
                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        T cell receptor; TCR; gastrointestinal; antiinflammatory; cytostatic; tuberculostatic; dermatological; antibacterial; virucide; gynaecological; cell therapy; Vgamma; mouse.
               and are capable of providing blood- typing reagents of high specificity and reliability. They can also be used in passive immunisation to prevent haemolytic disease of the newborn. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-WAR-2003 to correct PI field.)
                                                                                                                                                                                   Gaps

The invention relates to regulating a gammadelta T-cell mediated immune response in a mammal and involves administering to the mammal a soluble gammadelta T cell receptor (TCR). The method is useful for treating patients having, or are at risk of developing an intestinal condition, e.g. Crohn's disease, ischaemic colitis, irritable bowel disease, and colon cancer; a lung condition associated with inflammation such as airway hyperresposiveness, pneumonia, tuberculosis, and a primary or metastatic lung tumour; a skin condition associated with inflammation caused by bacterial infection, viral infection or laceration, and a skin cancer; or a condition associated with inflammation of the reproductive tract such as infection caused by bacterial infection caused by bacterial factor infection caused by bacterial infection used infection that involve the epithelial mucosal lining, a tubal infection, preventing tubal factor infertility, and a cancer selected from ovarian, cervical, uterine, prostate or testicular cancers. Sequences ABRR82485-489 represent murine TCR Vgamma chains used in the

BLyS is a member of the tumour necrosis factor (TMF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatio, immunosuppressive, immunostimulant, immunomdulatory, antitheumatic and antithEADS activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in associated with aberrant expression of BLyS. They may also be associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression
                                                                                                                       BLys; B lymphocyte stimulator; TNF superfamily; human, cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulant; immunomodulatory; antirheumatic; antiAIDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

This invention describes novel antibodies that immunospecifically bind to Elymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAlDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthitis, immune, and autoimmune disorders and immune disorders and elemented of the systemic lupus erythematosus, rheumatoid arthitis, immune, and autoimmune disorders and elemented the statement by the such as concer, immune, and autoimmune disorders and elemented the systemic lupus erythematosus, rheumatoid arthitis, and autoimmune disorders and elemented the systemic lupus erythematosus, rheumatoid arthitis, and autoimmune disorders and elemented the systemic lupus erythematosus, rheumatoid arthitis, and autoimmune disorders and elemented the systemic lupus erythematosus, rheumatoid arthitis, and activity such as concer, immune, and autoimmune disorders and elemented the systemic lupus erythematosus, rheumatoid arthitis, and autoimmune disorders and elemented the systemic lupus erythematosus, rheumatoid arthitis, and autoimmune disorders and elemented the systemic lupus erythematosus, rheumatoid arthitis, and autoimmune disorders and elemented the systemic lupus erythematosus, rheumatoid arthitis, and autoimmune disorders and elemented the systemic lupus erythematosus, and autoimmune disorders and elemented the systemic lupus erythematoid and elemented
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BLys; B lymphocyte stimulator; TNF superfamily; human; cytostatic; tumour necrosis factor; B cell proliferation; B cell differentiation; immunosuppressive; immunostimulat; immunomodulatory; antirheumatic; antiAIDS; vaccine; cancer; immune; autoimmune disorder; immunodeficiency; systemic lupus erythematosus; rheumatoid arthritis; CVID; AIDS; common variable immunodeficiency; acquired immunodeficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

rine present into the control of the properties of the present into present in the present in ABQB1842 and ABQB1843, or a sequence exhibiting at least 90% identity or which hybridises with the sequence exhibiting at least 90% identity or which hybridises with the sequence given in ABQB1842 and ABQB1843. Also described is a polymucleotide (II) encoding a fusion protein, comprising a sequence selected from 1097 sequences given in ABQB2828 to ABPG6354 ligated in frame to a polymucleotide encoding a ctivities, and can be used as an inhibitor of Salmonella. (I) (which is a probe) is useful for the detection and/or identification of activities, and can be used as an inhibitor of Salmonella. (I) (which is a lift dobacterium longum in a biological sample. A carrier containing the lactic acid bacterium Bifidobacterium longum NCC2705 (CNCM I-2618) can be used for preventing and/or treating diarrhoea brought about by pathogenic bacteria and/or rotavirus. The carrier is a food composition selected from milk, yogurt, curd, cheese, fermented milks, milk based fermented creal based products, infant formula, pet food or a pharmaceutical composition selected from tablets, liquid bacterial suspensions, dried oral supplement, wet oral supplement, dry tube feeding or wet tube feeding. (I) is useful in DNA arrays or chips to carry out analysis of the sufidobacterium related nucleotide sequences given in the Sequence of the Bifidobacterium sequences given in the Sequence of the Bifidobacterium sequences given in the Sequence of the Bifidobacterium sequences given in the Sequence of the Bifidobacterium sequences given in the Sequence of the Bifidobacterium sequences given in the Bifidobacterium sequences given in the Bifidobacterium sequences given in the Sequence of the Bifidobacterium sequences given in the Sequence of the Bifidobacterium sequences given in the Bifidobacterium sequences given in the Sequence of the Bifidobacterium sequences given in the Sequence of the Bifidobacterium sequences given the Sequence of the Bifidobacte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotide comprising Bifidobacterium genome sequence useful as a probe or primer for detecting and/or identifying Bifidobacterium longum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Listing from the present invention but not mentioned further within the specification. N.B. The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the European Patent Office
                                                                                                                                                                            Bifidobacterium longum NCC2705; Bifidobacterium; bacterial; antidiarrheic; antibacterial; inhibitor of Salmonella; detection; identification; lactic acid bacterium; diarrhoea; pathogenic bacteria; rotavirus; food composition; pharmaceutical composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a polynucleotide (I) comprising a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ..

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sequence tags for identifying expressed cativity of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in printed specification, but was obtained in processing the printed specification, but was obtained in the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                         Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        60.0%; Score 39; DB 4; Length 61; 50.0%; Pred. The invention relates to novel isolated human secreted polypeptides (I)

and polymucleotides (II). (I) and (II) are useful for treating

conditions such as arthritis, nephritis, Crohn's disease,

ischaemia-reperfusion injury, shock, sepsis, immune responses, and is

involved in increasing haematopoiesis, stem cell survival, bone growth

and remodeling. (I), (II) and modulators of (II) are useful for

prophylaxis or treatment of one or more cancers. (II) is also useful for

creating transgenic animals useful for studying the in vivo activities of

the polypeptide as well as for studying modulators of the polypeptides.

(I) induces the proliferation of neural cells and regeneration of nerve

and brain tissue and is useful for the treatment of central and

parkinson's disease, Huntington's disease, and amyotrophic lateral

calerosis. In addition, (I) is involved in chemotactic or chemokinetic

activity, regulation of haematopoiesis and is useful for treating myeloid

cor lymphoid cell disorders, platelet disorders such as thrombocytopenia

and for regeneration of bone, cartilage, tendon, ligament and/or nerve

tissue growth, and in tissue repair, healing of burns, incisions, ulcers,

for treating osteoporosis, osteoarthritis, bone degenerative disorders and

protection or regeneration and treatment of lung or liver fibrosis,

creperfusion injury in various tissues, various immune deficiencies and

disorders including severe combined immunodeficiency (SCID), bacterial or

thougal infections, autoimmune disorders en multiple sclerosis,

theumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic

cheumatoid arthritis, diabetes mellitus, myasthenia gravis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Zhou P;

reactions and conditions, such as asthma or other respiratory problems. In addition, (1) affects biorhythms or circadian cycles of rhythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU28395 represent novel human secreted protein amino acid sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated polypeptide (I) related to dendritic cells of the immune system and the polynucleotide (II) encoding (I). (I) is useful for screening for candidate therapeutic agents. (II) is useful for studying the presence, amount, distribution and normalcy of certain gene products produced by or expressed on dendritic cells. (II) is also useful to facilitate the discovery of compositions and methods useful for diagnosing and treating certain disease states. (I) and (II) are useful for diagnostic and therapeutic purposes. (I) is useful in binding studies, for construction and expression of modified molecules, for structure/function studies and for the preparation of polyclonal and

monoclonal antibodies. (I) is also useful as immunogenic components (e.g. antigens) for preparing antibodies or as targets for binding agent studies. (I) is useful in the treatment of conditions associated with abnormal physiclogy or development, e.g. disease or disorder associated with abnormal expression or abnormal signaling by a dendritic cell. (I) is also useful in the regulation and development of hemaropoinetic cells. The binding agent is useful to isolate and purify the immunogenic components by immunoaffinity chromatography, and as probes to distinguish expression libraries for particular expression products. (II) is useful as templates for the recombinant production of peptides and polypeptides, as probes and primers for the detection of the human genes, for chromosome mapping and as probes or to design PCR primers to identify chomologous genes in other mammalian species. The present sequence represents the amino acid sequence of human dendritic cell-derived
                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; Molecules for Disease Detection and Treatment; MDDT; MDDT-angonist; Gene therapy; cardiant; cytostatic; europyretetive; cardiovascular disorder; neurological disorder; cell proliferative disorder; autoimmune disorder; inflammatory disorder; developmental disorder; cancer; steroid metabolic response.

This invention relates to novel polypeptides associated with Molecules for Disease Detection and Treatment (MDDT) and the cDNA sequences which encode them. MDDT-antagonists, MDDT-agonists or gene therapy may produce cardiant, cytostatic and neuroprotective activities. The polypeptides and Composition for the invention may be useful for the preparation of a associated with decreased expression or over-expression of functional MDDT proteins, for example cardiovascular, neurological, cell proliferative, autoimmune/inflammatory or developmental disorders. They may also be useful in the treatment and diagnosis of cancer, diseases treated with steroids and disorders caused by the metabolic response to treatment with steroids. The present sequence is the amino acid sequence of a human Molecule for Disease Detection and Treatment (MDDT) of the
                             New Molecules for Disease Detection and Treatment polypeptides, useful for preparing a composition for diagnosing or treating e.g. cardiovascular or neurological disorders.

Novel human isomerases useful for diagnosing, preventing and treating immune disorders, inflammatory disorders and cell proliferative disorders

Claim 1; Page 88-89; 102pp; English.

including cancer.

```
The present sequence is an isolated human isomerase (ISOM) polypeptide. It is useful for treating a disease or condition associated with decreased or increased expression of functional human isomerase. It is useful for treating immune disorders such as inflammation, acquired immunodeficiency syndrome (AIDS), Addison's disease, adult respiratory distress syndrome (AIDS), allergies, namenia, asthma, atherosclerosis, Crohn's disease, atopic dermatitis, glomerulonephitis, Grave's disease, Hashimoto's thyroiditis, multiple sclerosis, osteoporosis, rheumatoid authinitis, psoriasis, myccardial or pericardial inflammation, and autoimmune diseases, diabetes mellitus, cancers and cell proliferative disorders such as actinic keratosis, prostatitis, cirrhosis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, secreted protein, arthritis, Crohn's disease; sepsis, shock, ischaemia-reperfusion injury, haematopoiesis, cancer, neuropathy, transgenic animal, Alzheimer's disease; Parkinson's disease, burn, amyotrophic lateral sclerosis, platelet disorder; thrombocytopenia, ulcer; osteoporosis, bone degenerative disorder; periodontal disease; gut protection; lung, liver fibrosis; immune deficiency; infection; severe combined immunodeficiency, SCID; autoimmune disorder; allergy, multiple sclerosis; rheumatoid arthritis; diabetes mellitus; asthma;

intramarcty contactous were as arturita, neparation; crown as arturita, neparation; crown as arturita, neparation; crown as arturita, neparation; crown and increasing haematopoiesis, stem cell survival, bone growth and emodulators of (II) are useful for and remodulators of (II) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for creating transgenic animals useful for studying the in vivo activities of the polypeptides as well as for studying modulators of the polypeptides.

(I) induces the proliferation of meural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and perkinson's disease, Huntington's disease, and amouropathies, such as Alzheimer's, parkinson's disease, Huntington's disease, and amouropathies, concenting myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopenia and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, ulcers, or periodoncal disease. Furthermore, (I) is also useful for get correction or regeneration and treatment of lung or liver fibrosis. reperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. In addition, (I) affects biorhythms or circadian cycles of thythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides activity and can act as an antigen in a vaccine composition to raise an immune response. AdU28020-AAU28395 represent novel human secreted protein The invention relates to novel isolated human secreted polypeptides (I) and polynucleotides (II). (I) and (II) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, amino acid sequences of the invention

```
The invention relates to a purified polypeptide with alpha-amylase activity and the polymucleotide encoding it. The polypeptide is useful for hydrolysing starch linkages, for catalysing the breakdown of a starch, for modifying small molecules, for liquefying starch, for washing an object, for textile desizing, for treating lignocellulosic fibers, for improving fibre properties, for enzymatic de-inking of recycled paper pulp, for producing a high-maltose or high-glucose syrup or a mixed syrup, and for increasing the flow of production fluids from a subterranean formation by removing a viscous, starch-containing, damaging think formed during production operations and found within the cuber completed well bore. The polypeptide is also useful for preparing a dough or a baked product proparated from the dough and in corn-wet milling processes, detergents, baking processes, beverages, oil fields (fuel ethanol), brewing processes and starch modification in the paper and pulp industry, for removing starch containing stains from a material and for reducing staining of
                                                                                                                                                                                                    Novel purified polypeptide with alpha-amylase activity, useful e.g. fo
liquefying starch, for textile desizing, for treating lignocellulosic
fibers, and for producing high-maltose or high-glucose syrup.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             starch containing stains from a material and for reducing staling of bakery products. plant stability

```
The invention relates to 1 of 232 isolated or recombinant polynucleotides encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered behance to a wild-type or reference plant, or the plant exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer readable medium having stored sequence information, and identifying a chance given in the specification. The isolated or sequences comprising sequence information selected from one of 464 fully defined sequence given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a modified trait, the method comprising selecting a polynucleotide that encodes a polypeptide or an antisense nucleic acid, into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polymeptide or antisense nucleic acid, thereby producing a modified trait, and selecting or antisense nucleic acid, into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polymental stress response (e.g. drought), microbial disease response response (e.g. drought), microbial disease response response response traits listed in the specification). The present sequence and many other traits listed in the specification). The present sequence and many other traits listed in the specification).
                                                                                                                                                                                                                                                                                                                                                 isolated or recombinant polynucleotide used to produce a transgenic

The invention discloses a transgente plant naving an a transpent of the combinant polynucleotide with at least 6 consecutive amino acids of one of the amino acids sequences given in the specification. The recombinant polynucleotide with at least 6 consecutive amino acids of one of the amino acids sequences given in the specification. The recombinant polynucleotide. Also claimed are methods for altering the expression levels of at least one gene of a plant, altering the expression levels of at least one gene of a plant, altering a trait associated with a plant's roots and altering a plant's trait. The ecombinant polynucleotide the promoter is constitutive or inducible or root-active. The method for altering a trait associated with roots comprises transforming a plant with the recombinant polynucleotide.

Toot-active. The method for altering a trait associated with roots comprises transformed plants and identifying a transformed plant with the recombinant polynucleotide and selecting the transformed plants and identifying a transformed plant. The method for altering a plant with the recombinant polynucleotide and selecting the transformed plant. The method for altering a plant with the recombinant polynucleotide and selecting the transformed plant. The method for altering a plant with the recombinant polynucleotide and selecting a plant of the transformed plant. The method for altering a plant with the recombinant polynucleotide and selecting a plant of the transformed plant. The method for altering a plant in the plant is plant comprises providing a database sequence comparing the database sequence criteria and transforming the selected database sequence in the plant. The methods also comprises providing a test polynucleotide, hybridising the test polynucleotide at a polynucleotide and selecting the test polynucleotide and selecting the test polynucleotide and selecting the test polynucleotide and selected sequence criteria and transforming a plant with the recombinant polynucleotide at low stringents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of the plant. The transgenic plant is useful for altering a plant's for increasing plant stability. The sequence presented is a protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ransforming the hybridising test polynucleotide in a plant to alter
The invention discloses a transgenic plant having an A. thaliana

Sequence 24066, Application US/09252991A

Sequence 24066, Application US/09252991A

Fabricant No. 65517-095

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: MUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: ARRUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.136

CURRENT FILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

LENGTH: 448

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 21,

GENERAL INFORMATION:
APPLICANT: Bondish, Katherine S.
APPLICANT: Brederickson, Shana
APPLICANT: Renshaw, Mark
APPLICANT: Renshaw, Mark
APPLICANT: Renshaw, Mark
APPLICANT: INTURENCE TOSHIAK!
TITLE OF INVENTION: ENGINEERED TEMPLATES AND THEIR USE IN SINGLE PRIMER AMPLIFICATION
FILE REFERENCE: 1087-21
CURRENT FILING DATE: 2002-09-19
PRIOR APPLICATION NUMBER: US 60/323,455
PRIOR PLING DATE: 2001-09-19
NUMBER OF SEQ ID NOS: 278
SOFTWARE: Patentin version 3.2
SEQ ID NO 173
LENGTH: 110
TYPE: PRT

CORANISM: human
APPLICANT: Holet, Thor
TITLE OF INVENTION: Improvements to ribosome display
FILE REFERENCE: 84633
CURRENT APPLICATION NUMBER: US/09/817,661
CURRENT FILING DATE: 2001-03-26
PRIOR APPLICATION NUMBER: US 60/193,802
PRIOR FILING DATE: 2000-03-31

probable SCARECROW gene regulator [imported] - Arabidopsis thaliana
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Accession: T02736; A84692
R;Rounsley, S.D.; Lin, X.; Kaul, S.; Shea, T.P.; Fujii, C.Y.; Mason, T.M.; Shen, M.; Ronr submitted to the EMBL Data Library, August 1998
A;Description: Arabidopsis thaliana chromosome II BAC T914 genomic sequence.
A;Reference number: Z14710
A;Reference number: Z14710
A;Reference number: Lanslated from GB/EMBL/DDBJ
A;Status: translated from GB/EMBL/DDBJ
A;Status: Lranslated from GB/EMBL/DDBJ
A;Cross-references: EMBL:AC005315; NID:g3461834; PID:g3461846
